

ABSTRACT

A re-sealable container closure label including a base label and a cover label, and a hook-and-loop fastener system and a tamper-evident tear strip is sandwiched therebetween. In a preferred embodiment, the base label is adhered to the front wall of a container, preferably a bag, adjacent an opening in the bag. A flap of the bag is folded downwardly over the opening and adheres to the front wall, the cover label, the two-part hook-and-loop fastener system and the tear strip. In an alternative embodiment, container closure label includes a hook-and-loop fastener system and a tear strip secured only to a base label. This alternative embodiment label is adhered to the front wall of a bag as in the preferred embodiment, except that the flap is adhered directly over the fastener system and tear strip. To open a bag sealed with the re-sealable container closure label, a user pulls the tear strip, which permits the flap to open and form a pour opening. The user may re-seal the flap portion with the hook-and-loop fastener system.
